

What is a California marine protected area (or “MPA”)?

An MPA is a type of managed area whose main purpose is to protect or conserve marine life and habitats in ocean or estuarine waters. California's MPA Network consists of 124 areas with varying levels of protection and 14 special closures, all designed to help safeguard the state's marine ecosystems. Most marine conservation areas such as Big Flat State Marine Conservation Area provide some opportunity for commercial and/or recreational take (species and gear exceptions vary by location - see reverse).

One goal for California's MPAs was to strategically place them near each other to form an interconnected network that would help to preserve the flow of life between marine ecosystems. Within that network each MPA has unique goals and regulations, and non-consumptive activities, permitted scientific research, monitoring, and educational pursuits may be allowed.

Why was this location chosen for a state marine conservation area?

One of the goals for Big Flat State Marine Conservation Area is to protect the sandy seafloor and rocky reefs found there. The conservation area also protects the upper reaches of a submarine canyon known as Spanish Canyon. Big Flat State Marine Conservation Area is one of 28 California MPAs that include submarine canyon and steep wall habitat deeper than 650 feet. Flatfishes such as California halibut and petrale sole blend in easily with the sediments that cover most of the conservation area's seafloor, while rockfish, lingcod, and kelp greenling find refuge in the holes and crevices of the rocky reefs. Soft corals, sponges, white-plumed anemones, Dungeness crab, sea stars, and sea cucumbers all thrive within the conservation area's various habitats.

Placing a state marine conservation area here provides moderately high levels of protection for marine life and the habitats they use.
